                                                                                                                                                                                                                                     AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. Library prepd. from the murine bone marrow derived stromal cell line library prepd. from the murine bone marrow derived stromal cell line ac 6. This cDNA was isolated from a substracted sub-library contg. Genes induced by treatment of the stromal cell line with interleukingens induced by treatment of the stromal cell line with interleuking. I (IL-1). The message levels for cyp C show a 2-3 fold induction by treatment with IL-1, and this cDNA exhibits a high level of homology with known cyclophilins. Cyp C is distinct from mammalian cyclophilins A and B in both sequence and tissue distribution of possesses peptidyl-prolyl isomerase (Pplase) activity which can be completely inhibited by addition of cyclosporin A (CsA). These cyp C fusion proteins can be used as ligands for the identification of intracellular proteins which together form high affinity associations. For example, the cyp C fusion protein binds to a protein of 77 kb in the absence of CsA, while in the presence for CsA it no longer binds to this p77, but instead binds specifically to a protein of 55 kb, identified as calcineurin (U.S.S.N.07/740175).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cyclophilin-like peptidyl prolyl cis-trans isomerase; CYPB; food processing; Endoplasmic retention signal; cis-trans isomerization; protein secretion; toxin; ADP-glucose pyrophosphorylase; glucanase; beta-1,4-endoglucanase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                 Cyclophilin C polypeptide and nucleic acid encoding it - useful for screening a tissue-specific immunosuppressive agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                89.8%; Score 44; DB 14; Length 212;

                                                                                                                 This sequence shows Aspergillus niger cyclophilin-like peptidyl prolyl cis-trans isomerase (CYPB). CYPB is capable of catalyzing the cis-trans isomeration of a peptide bond on the N-terminal side of proline residues in polypeptides. CYPB are useful in methods for increasing the yield of secreted polypeptides from cells. The secreted polypeptides may be enzymes (such as chymocain, thaumatin or alpha-galactosidase) that can be used in food processing, a pest toxin, adenosine diphosphate (ADP)-glucose pyrophosphorylase, a glucanase or beta-1,4-endoglucanase.
                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                               New peptidyl prolyl cis-trans isomerase, designated CYPB, from Aspergillus niger, useful in methods for increasing the yield of secreted polypeptides, such as enzymes used in food processing, from cells
                                                                                                                                                                                                                                               Gaps

                                                                      Submitted (FEB-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: PEPTIDYL-PROLYL CIS-TRANS ISOMERASES ACCELERATE THE FOLDING OF PROTEINS (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS IN OLIGOPEPTIDES.
-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PEPTIDYL-PROLYL CIS-TRANS ISOMERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                   PEPTIDE BONDS IN OLIGOPEPTIDES.

-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PEPTIDYL-PROLYL CISTRANS ISOMERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                              01-NOV-1996 (TrEMBLrel. 01, Created)
U-NOV-1996 (TrEMBLrel. 01, Last sequence update)
01-JUN-2001 (TrEMBLrel. 17, Last annotation update)
PEPTIDYL-PROLYT CIS-TRANS ISOMERASE PRECURSOR (EC 5.2.1.8) (PPIASE)
(ROTAMASE) (CYCLOPHILIN) (CYCLOSPORIN A-BINDING PROTEIN).
FUNCTION: PEPTIDYL-PROLYL CIS-TRANS ISOMERASES ACCELERATE THE
         FOLDING OF PROTEINS (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PEPTIDYL-PROLYL CIS-TRANS ISOMERASE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

PEPTIDYL-PROLYL CIS-TRANS ISOMERASE (EC 5.2.1.8) (PPIASE) (ROTAMASE)
CYCLOPHILIN HOWOLOG).
Streptomyces chrysomallus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Purification and properties of multiple molecular forms of yeast peptification and properties of multiple molecular forms of yeast peptification and properties of multiple molecular forms of yeast peptification and properties of multiple molecular forms of yeast benchim. Blophys. Acta L161:161-167 (1993).

-!- RUNCTION: PPIASES ACCELERATE THE FOLDING OF PROTEINS.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS IN OLIGOPEPTIDES.
-!- ENZYME REGULATION: BINDS CYCLOSPORIN A (CSA). CSA MEDIATES SOME OF ITS EFFECTS VIA AN INHIBITORY ACTION ON PPIASE.
-!- SUBCELULIAR LOCATION: CYTOPIASMIC.
-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.
                                                                                                                             "Yeast cyclophilin: isolation and characterization of the protein,
                                                                                                                                                                                                                                                 SECUENCE FROM N.A.

"Streptomycetes possess peptidy1-proly1 cis-trans isomerases that
strongly resemble cyclophilins from eukaryotic organisms.";
Mol. Microbiol. 6:351-358(1992)
-!- FUNCTION: PPIASES ACCELERATE THE FOLDING OF PROTEINS.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMBRIZATION OF PROLINE IMDIC
PEPTIDE BONDS IN OLIGOPEPTIDES.
-!- ENZYME REGULATION: BINDS CYCLOSPORIN A (CSA). CSA MEDIATES SOME
OF ITS EFFECTS VIA AN INHIBITORY ACTION ON PPIASE.
-!- SUBCELLULAR LOCATION: CYTOPHASMIC.
-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.

Blochim. Blophys. Acta 1293, 31-38, 1966
A.Title: Evidence that human milk isolated cyclophilin B corresponds to a truncated form A.Feference number: S65742; MUID: 96186273
A.Molecule type: protein
A.Molecule type: protein
A.Residues: 26-30; 203 <AMR>
A.Experimental source: milk
C.Comment: This protein is distinguished from peptidylprolyl isomerase A by the presence C.Comment: This protein is distinguished from peptidylprolyl isomerase A by the presence C.Comment: This protein binds to and is inhibited by the immunosuppressive drug cyclospc C.Goment: This protein binds to and is inhibited by the immunosuppressive drug cyclospc C.Goment: This protein binds to and is somerization of peptidylprolyl isomerase; cyclophilin homology
C.Gomention:
A.Description: catalyzes the cis-trans isomerization of peptidylprolyl isomerase; cyclophilin homology
C.Superfamily: peptidylprolyl isomerase; cyclophilin homology
C.Superfamily: spetidylprolyl isomerase B #status experimental cMAT>
F:1-25/Domain: signal sequence #status predicted
F:140/Binding site: carbohydrate (Asn) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A56861

Poptidylprolyl isomerase (EC 5.2.1.8) CyP-S1 precursor - mouse
N'Alternate names: cyclophilin B; cyclophilin-S1; cyclosporin A-binding protein
N'Alternate names: cyclophilin B; cyclophilin-S1; cyclosporin A-binding protein
C; Species: Mus musculus (house mouse)
C; Date: 05-Jan-1996 #sequence_revision 05-Jan-1996 #text_change 16-Jul-1999
C; Accession: A66801; B3972; S21835

A; Description: catalyzes the cis-trans isomerization of peptidylproline peptide bonds A;Note: activity is one-tenth that of the mammalian protein; high binding affinity fo C; Superfamily: peptidylprolyl isomerase; cyclophilin homology C; Keywords: acetylated amino end; blocked amino end; cis-trans-isomerase; cyclosporin F;1-162/Domain: cyclophilin homology <CYP>
F;2-162/Product: peptidylprolyl isomerase, cytosolic #status experimental <MAT>
F;2-Modified site: acetylated amino end (Ser) (In mature form) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peptidylprolyl isomerase (EC 5.2.1.8) - Streptomyces chrysomallus

The 5' ESTs different propared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic. Gorensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
          sequence represents a cyclophilin B peptide of the invention. The
                      peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

The invention relates to a composition for modulating somatolactogenic function, comprising cyclophilin B (CypB), a mutant of cyclophilin B (cyclophilin B compromed are absent) or an inhibitor of the interaction of cyclophilin B with a composition of the interaction of cyclophilin B with a composition or an inhibitor of the interaction of cyclophilin B with a composition or also relates to a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB levels in a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic function in the animal, and cyclophilin B mutant or a composition comprising an inhibitor of the interaction of cyclophilin B with a somatolactogenic function in the animal. A composition comprising cyclophilin B is useful in the treatment of immunosuppression, in the treatment of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B with a somatolactogenic composition composi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel composition for modulating somatolactogenic function, comprises cyclophilin B, its mutant or an inhibitor of interaction of cyclophilin B with somatolactogenic hormone \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human cyclophilin B; CypB; prolactin-binding; growth hormone-binding; somatolactogenic function modulator; immunosuppression; short stature; muscle wasting; osteoporosis; HIV infection; breast cancer; prostate cancer; glgantism; acromegaly; hyperprolactinaemia; c-terminal deletion mutant; mutein.

function, comprising cyclophilin B (CypB), a mutant of cyclophilin B (Particularly a CypB mutant in which residues 2-12 of the mature protein are absent) or an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone (e.g., prolactin, growth hormone). The invention also relates to a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB levels in a sample from a patient. Cyclophilin B is cyclophilin B mutant or a composition comprising an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone, is useful for inhibiting somatolactogenic function in the animal. A composition comprising cyclophilin B with a somatolactogenic hormone, is useful for in the treatment of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprising cyclophilin B cyclophi
       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprises
cyclophilin
                                                                                                                                                                                                                                                                                                                                                                                                                              Human cyclophilin B; CypB; prolactin-binding; growth hormone-binding; somatolactogenic function modulator; immunosuppression; short stature; muscle wasting; osteoporosis; HIV infection; breast cancer; prostate cancer; gigantism; acromegaly; hyperprolactinaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a composition for modulating somatolactogenic
       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hormone, is useful for treating HIV infection, breast and prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   glgantism/acromegaly, and hyperprolactinaemia. The present a represents human cyclophilin B.

include: cytostatic; proliferative; unlnerary; immunomodulator; antiatheric; antiatherative; unlnerary; immunomodulator; antiatheratic; cagulant; concirole; assortopic; antiatheratic and antiangioganic. The controlections and polypeptides can be used for preventing, treating or ameliorating medical conditions and antianging stand antiagonists from the present invention may be used to treat immune disorders by activating to rinhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate haemostatic or thrombolytic activity, modulate baction, and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB4240 represent sequences used in the exemplification of the present invarior invarior.
                                                                                                                                                                                                                                                                                                                                                                                    dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antianglogenic; gene therapy; inflammation; immune disorder; haematopoletic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection; neurological disease; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities
                                                                                                                                                                                                                                                                                                   Human: cancer associated gene; cancer antigen; detection; cancer;

The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, veast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polypeptide for treatment of diseases, diagnostics, raising antibodies and research use -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell colorectal carcinomas and cancers. Additionally, and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Addition of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present sequence represents human cyclophilin D which is a mitochondrial core component. Cyclophilins interact with other commonants core components e.g. adenine nucleotide translocator (ANT) proteins to regulate MPT. ANT proteins are mitochondrial permeability transport to proteins to regulate MPT. ANT proteins are mitochondrial permeability transition (MTP) pore components responsible for mediating transport of ADP across the mitochondrial inner membrane. The present invention relates to a novel nucleic acid expression construct comprising a promoter operably linked to a polynucleotide encoding a mitochondrial concent protein (EFM) protein (e.g. ANT) fused to an energy transfer molecule (EFM) protein (e.g. ANT) fused to an energy transfer component polypeptide (e.g. ANT) fused to an energy transfer component polypeptide (e.g. ANT) fused to an energy transfer concentration (e.g. and protein (e.g. and protein for a protein (e.g. and protein (e.g. and protein for a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                 New nucleic acid expression constructs, useful for screening for agents
                                                                                                  that alter mitochondrial permeability transition (MPT), comprises polynucleotide encoding MPT polypeptide or cyclophilin polypeptide fused to energy transfer molecule

The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This protein is the human nucleoporin nup358 which is used to obtain tryptic peptides which are used in a method for detecting cervical cancer. The method involves detecting the presence of a cervical cancer-associated protein (CVC) in a tissue or body fluid sample. The CVC is characterised as having a molecular weight of 44900-69400 Daltons as determined by sodium dodecyl-sulphate (SDS)-PAGE techniques and an isoelectric point (PI) of 5.1-6.6 as determined by standard isoelectric focusing the protein is further characterised as being a non-chromatin protein which is detectable at a higher level in a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection and therapy of cervical cancer - using specific cervical cancer-associated proteins as targets for treatment or as indicators for detection
                                                                                                                                                                                                                                                             Gaps

human secreted proteins given in AAF33037 to AAF33085 encode the human secreted proteins given in AAB64666 to AAB64714. AAB64715 to AAB6471 represent human secreted polypeptide sequences and proteins composed to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues condition. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: continifiamments; antiarthritis; dermalogical; cardiant: antialinflamments; antiarthritis; and anti-ulcer. The polynucleotides and polypeptides can be used in the prevention, treatment and diagnosis of diseases associated with inappropriate polypeptide expression. Disorders that may be treated or prevented include solid tumours, conformation arthritis, psoriasis, diabetic retinopathy, myocardial conjugementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and therefore which patients may be in need of restorative therapy. The polypeptides
                                                                                                                                                                                                           ö
cervical cancer cell than in a normal human cervical cell, as determined by 2D-gel electrophoresis. The methods can be used for the early and rapid detection of cervical cancer, for treating cervical cancers and for monitoring the efficacy of such treatment.
                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; diagnosis; cytostatic; antirheumatic; antiarthritic; dermalogical; cardiant; antiinflammatory; anti-ulcer; gastrointestinal; solid tumour; rheumatoid arthritis; psoriasis; diabetic retinopathy; myocardial anglogenesis; Crohn's disease;

may also be used as antigens in the production of antibodies against the polypeptide and in assays to identify modulators (agonists and antagonists) of polypeptide expression and activity. The anti-polypeptide antibodies and antagonists may also be used to down regulate expression and activity. AAF33028 to AAF33036 and AAB64665 represent sequences used in the exemplification of the present invention.

The sequence given is encoded by the protein IA gene of Neisseria gonorrhoeae. PIA is a major outer membrane proteins of N. gonorrhoeae which act as a porin. Porins are believed to act in cells by channelling low molecular weight substances across the hydrophobic lipid outer membrane. Elucidation of the gene sequences of PIA and PIB allows the production of antiganic fragments by recombinant DNA techniques. These fragments can be used as immunogens in vaccine compositions for the prevention of gonorrhoea, and also on immunoassays for diagnosis of infection. See also AAR27484.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT

peptidylprolyl isomerase (EC 5.2.1.8) B precursor [validated] - human N.Alternate names: cyclophilin B; cyclosporin A-binding protein B; S-cyclophilin C; Species: Home sapiens (man) C. Species: Home sapiens (man) C. Sate: 31-Mar-1992 #sequence_revision 31-Mar-1992 #text_change 08-Dec-2000 C; Accession: A39118; A39722; A40515; S65742 R; Price, E.R.; Zydowsky, L.D.; Jin, M.; Baker, C.H.; McKeon, F.D.; Walsh, C.T. Proc. Natl. Acad Sci. U.S.A. 88, 1903-1907, 1991 A; Title: Human cyclophilin B: a second cyclophilin gene encodes a peptidyl-prolyl iso A; Reference number: A39118, MUID:91156714
